

Applications

PACKAGING APPL CAT ON EMPRIME PRINTING MACHINE STATIC APPLICATION

In emprime printing machines, paper surface is charged with static charge when paper bobbin is unwrapped. Paper attracts dust and particles until sent to drier before and after printing. These are undesired behaviours and result in lossy and incorrect production.

As seen in the figure, anti-static bar which is installed on input and output points of emprime machines will neutralize static charges on paper surface. Thus, printing is applied correctly and high quality and reliable printing is executed.
